How to Set Your Chronos Password or Run Chromeos-setdevpas...

Apr 22, 2025 · Ensuring the security of your **Chronos password** on **ChromeOS** is crucial for protecting your device from unauthorized access. By following these simple steps, you can **set a strong password** and run '**chromeos-setdevpasswd**' to enhance your device's security.

google chrome os - Reset root password for Chromebook - Super...

I can type '**chronos**' at the **login** prompt and the **password** I had **set** for it, and it works, but not for '**root**'. Once I'm logged in as '**chronos**', I do '**sudo su**', type the **chronos password**, and I'm root. I try to change the root **password** with **passwd**, and it tells me 'Authentication token lock busy'.

Starting from the desktop, logged in as a user[1], the following steps have solved this...

I just spent several hours trying to figure this out. In particular, `Ctrl-Alt-F2` (AKA '`->`') was only...

1.) localhost login: root
password: The password is the password you set for enabling debugging...

Why is the chronos password different from the root password?

My device is a Samsung Chromebook 4. Most of the answers I find are confusing **chronos** and **root**. using the terminal `Ctrl + Alt + F2` (right facing arrow) you will be prompted to **set a password** for **chronos** (dev pw) by entering user: **chronos** pw: test0000. Followed by the command **chromeos-...**

Developer Mode | MrChromebox.tech

Dec 27, 2025 · On the **login** screen, press `[CTRL+ALT+F2]` (F2 is right-arrow on most **ChromeOS** keyboards), then **login** with user **chronos** (no **password** is required, nor should one be **set**).

Github
<https://github.com/danabird/chronos/blob/master/README.md#password>

By default, there is no **password** for **chronos** or **root** so if one is **set**, you'll have to remove it. Before installing a new **chroot** or anything else, it might be best if you saved everything you need in `~/Downloads`, etc. and do a 'powerwash'.

TIL that if you have your chromebook in developer mode you can ...

`setdevpassword` creates a **login password** for the '**chronos**' user. That's the user you are logged in as, from the system's perspective (on top of which, you then **login** to your Google account). When you are running a shell in **chrome os** (either via `crash`, or via `vt-2`), you are automatically running as '**chronos**'.

chronos root password on a new lenovo n21 - Google Groups

We tried logging in with **chronos** for user and blank for **password** as per instructions (the command line shows `chronos@localhost`). Alternatively we've tried setting the root **password** in step 1, along with a variety of default **passwords** like `facepunch`, **chronos**, **chromium**, **password**, and `test0000`.
