

Firefox DevTools User Docs

Firefox Developer Tools is a set of web developer tools built into Firefox. You can use them to examine, edit, and debug HTML, CSS, and JavaScript.

This section contains detailed guides to all of the tools as well as information on how to debug Firefox for Android, how to extend DevTools, and how to debug the browser as a whole.

If you have any feedback on DevTools or want to contribute to the project, you can [join the DevTools community](#).

📌 Note

If you are just getting started with web development and using developer tools, our [learning](#) docs will help you — see [Getting started with the Web](#) and [What are browser developer tools?](#) for good starting points.

The Core Tools

You can open the Firefox Developer Tools from the menu by selecting **Tools > Web Developer > Web Developer Tools** or use the keyboard shortcut `Ctrl` + `Shift` + `I` or `F12` on Windows and Linux, or `Cmd` + `Opt` + `I` on macOS.

The ellipsis menu on the right-hand side of Developer Tools contains several commands that let you perform actions or change tool settings.

[Documentation...](#)

[Community...](#)

	This button only appears when there are multiple iframes on a page. Click it to display a list of the iframes on the current page and select the one with which you want to work.
	Click this button to take a screenshot of the current page. (Note: This feature is not turned on by default and must be enabled in settings before the icon will appear.)
	Toggles Responsive Design Mode
	Opens the menu that includes docking options, the ability to show or hide the split console, and Developer Tools settings. The menu also includes links to the documentation for Firefox Web Tools and the Mozilla Community.
	Closes the Developer Tools

Page Inspector

View and edit page content and layout. Visualize many aspects of the page including the box model, animations, and grid layouts

Web Console

See messages logged by a web page and interact with the page using JavaScript.

JavaScript Debugger

Stop, step through, and examine the JavaScript running on a page.

Network Monitor

See the network requests made when a page is loaded.

Performance Panel

Analyze your site's general responsiveness, JavaScript, and layout performance.

Responsive Design Mode

See how your website or app will look and behave on different devices and network types.

Accessibility inspector

Provides a means to access the page's accessibility tree, allowing you to check what's missing or otherwise needs attention.

Application panel

Provides tools for inspecting and debugging modern web apps (also known as [Progressive Web Apps](#)). This includes inspection of [service workers](#) and [web app manifests](#)

❗ Note

The collective term for the UI inside which the DevTools all live is the [Toolbox](#)

More Tools

These developer tools are also built into Firefox. Unlike the “Core Tools” above, you might not use them every day.

Memory	Figure out which objects are keeping memory in use.
Storage Inspector	Inspect cookies, local storage, indexedDB, and session storage present in a page.
DOM Property Viewer	Inspect the page's DOM properties, functions, etc.
Eyedropper	Select a color from the page.
Style Editor	View and edit CSS styles for the current page.
Taking screenshot	Take a screenshot of the entire page or of a single element.

Measure a portion of the page	Measure a specific area of a web page.
Rulers	Overlay horizontal and vertical rulers on a web page
Custom formatters	Customize the way objects are displayed within the DevTools.
JavaScript tracer	Live display all JavaScript function calls.

For the latest developer tools and features, try Firefox Developer Edition.

[Download Firefox Developer Edition](#)

Connecting the Developer Tools

If you open the developer tools using [keyboard shortcuts](#) or the equivalent menu items, they'll target the document hosted by the currently active tab. But you can attach the tools to a variety of other targets, too, both within the current browser and in different browsers or even different devices.

about:debugging	Debug add-ons, content tabs, and workers running in the browser.
Connecting to Firefox for Android	Connect the developer tools to an instance of Firefox running on an Android device.
Connecting to iframes	Connect the developer tools to a specific iframe in the current page.

Debugging the browser

By default, the developer tools are attached to a web page or web app. But you can also connect them to the browser as a whole. This is useful for browser and add-on development.

Browser Console	See messages logged by the browser itself and by add-ons, and run JavaScript code in the browser's scope.
Browser Toolbox	Attach the Developer Tools to the browser itself.

Extending DevTools

For information on extending the Firefox DevTools, see [Extending the developer tools](#) over in the [Browser Extensions](#) section of MDN.

Migrating from Firebug

Firebug has come to the end of its lifespan (see [Firebug lives on in Firefox DevTools](#) for details of why), and we appreciate that some people will find migrating to another less familiar set of DevTools to be challenging. To ease a transition from Firebug to the Firefox developer tools, we have written a handy guide — [Migrating from Firebug](#)

Contribute

If you want to help improve the developer tools, these resources will get you started.
