APK & AAB ANALYSIS

APK Checker

Quickly inspect any APK: package name, version, SDK levels, permissions, and signature, before you ship or install it.

APK Checker is part of APKLint, an online toolkit for inspecting Android APK files.

Quickly inspect any APK: package name, version, SDK levels, permissions, and signature, before you ship or install it. Upload an APK in your browser to view the relevant details; results reflect what the file itself exposes.

ANALYZE · APK CHECKER

Analyze

Done.

Release-readiness check for com.ucampaignapp.americafirst v2.3.0 — 1 high-severity issue and 6 warnings.

ERROR Exported content provider without permission

Content provider "com.facebook.FacebookContentProvider" is exported and has no android:permission. This can expose your app's data to any other app. Set android:exported="false", or guard it with read/write permissions.

WARN Exported activity without permission

<activity> "com.facebook.CustomTabActivity" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver> "io.branch.referral.InstallListener" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver> "com.phunware.engagement.internal.receiver.RebootReceiver" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver>
"com.phunware.engagement.internal.receiver.SignificantLocationUpdateReceiver" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN High-risk permission: ACCESS_BACKGROUND_LOCATION

android.permission.ACCESS_BACKGROUND_LOCATION is a sensitive permission Google Play scrutinizes closely. Make sure you have a genuine, declared use and complete any required Play Console declaration — otherwise it can get the app rejected.

WARN targetSdkVersion is below Google Play's API 35 target rule (reviewed 2026-06-27)

targetSdkVersion is 28. As of 2026-06-27, Google Play required new apps and

updates to target at least API 35 (Android 15) — Wear OS, Android TV, and Automotive have separate timelines. Play requirements change over time, so verify the current target-API rule in the Play Console before release. A lower target also misses newer security and privacy defaults.

INFO App

Trump 2020 · package com.ucampaignapp.americafirst

INFO Version

versionName 2.3.0 (versionCode 302070)

INFO Network security config present

A network security config is referenced (@7F140001). Good — confirm it disables cleartext and limits trusted CAs as you intend (you can paste it into the Network Security Config checker).

INFO Launcher activity is exported (expected)

<activity>

"com.donaldjtrump.android.presentation.feature.onboarding.LaunchActivity" is your launcher entry point, so it is meant to be exported. No action needed — this is normal for the activity that opens from the home screen.

INFO receiver relies on default exported

<receiver>

"com.phunware.engagement.internal.receiver.SignificantLocationUpdateReceiver" has an intent-filter but doesn't declare android:exported. Android 12+ (targetSdk 31+) requires it to be explicit — set it true or false.

INFO 7 runtime permission(s) requested

The app requests runtime ("dangerous") permissions:

ACCESS_BACKGROUND_LOCATION, ACCESS_COARSE_LOCATION, ACCESS_FINE_LOCATION, READ_CONTACTS, READ_EXTERNAL_STORAGE, READ_PHONE_STATE, WRITE_EXTERNAL_STORAGE. Each prompts the user and should map to a real feature — remove any you don't need.

INFO minSdkVersion

minSdkVersion is 23. That's a reasonable floor for a modern app.

INFO Signing certificate

Signed with scheme(s): v1, v2, v3.

INFO **DEX classes & methods**

10,313 classes, 69,253 methods (total methods exceed the classic 65,536 single-DEX limit, so multidex is in use).

Deleted after your scan. Files you upload are processed on our servers over an encrypted connection, then removed by the next hourly cleanup after analysis finishes (long scans are protected while they run). We never share them, and need no account.

About APK Checker

Quickly inspect any APK: package name, version, SDK levels, permissions, and signature, before you ship or install it.

APK Checker is part of APKLint's apk & aab analysis toolkit — Unpack, inspect, and break down Android packages. It's free to use and needs no account.

Your privacy is the default: files you upload are processed on our servers over an encrypted connection and permanently deleted by a scheduled hourly cleanup after analysis finishes, and never shared.

What APK Checker checks

- ✓ Whether the build is debuggable (a release blocker)
- ✓ targetSdkVersion against Google Play's API 35 target rule (reviewed June 2026)
- ✓ Signing scheme (v1/v2/v3) and certificate validity
- ✓ DEX method counts and a quick readiness verdict

Good to know: A readiness checklist on the binary — it can't predict the actual Google Play review outcome.

When to use APK Checker

Best for

A fast pre-share or pre-publish sanity check when you just need to confirm an APK's identity and that nothing obvious is wrong before handing it off.

Not the right tool for

Not for a full teardown (use APK Analyzer) or a security pass (use APK Security Scanner).

What you get back

Package name, versionCode/versionName, min/target SDK, the permission list, and whether the APK is signed, presented as a quick summary.

How it differs from related APKLint tools

It is the lightweight cousin of APK Analyzer: same family of facts, but framed as a quick readiness check rather than an exhaustive breakdown.

Limitations

A surface check by design; it will not decompile code or score security risk.

How to use APK Checker

- 1 Choose your APK file** — Drop an .apk file onto the page, or click to select it from your device.
 - 2 Send securely** — The file is uploaded over an encrypted connection to our analysis servers.
 - 3 Read your report** — APKLint unpacks and inspects the package and lays out the results on screen.
-

- 4 **Your file is removed** — It's deleted by an hourly cleanup job after analysis finishes.

Why use APKLint

Always free

Every tool is free with no login and no paywall. Reasonable file and input limits keep the free service stable.

No on-page ad banners

A clean, focused interface with no third-party ad banners cluttering your results.

Privacy-first

Files you upload are deleted by a scheduled hourly cleanup after analysis finishes, and never shared.

Open-source engines

Built on androguard for APK parsing and manifest/certificate analysis.

No sign-up

Start immediately — no account, login, or email required.

Works anywhere

Runs in any modern browser, on desktop or mobile.

Frequently asked questions

What does APK Checker do?

Quickly inspect any APK: package name, version, SDK levels, permissions, and signature,

before you ship or install it.

What does 'release-readiness' mean here?

It highlights things that commonly block a release or a Play submission: debuggable flag, low target SDK, weak signing, and exported surfaces.

Is it free to use?

Yes. Every tool on APKLint is completely free, with no sign-up and no account.

How is my data handled?

Your uploaded file and its result are processed on our servers over an encrypted connection, then removed by the next hourly cleanup after analysis finishes. We never share them.

What files can I send?

An Android APK — a .apk file — up to 1 GB.
