SECURITY & MALWARE

Mobile App Security Audit

Run a static, OWASP-style security review of your APK: insecure settings, exposed components, and best-practice gaps.

Mobile App Security Audit is part of APKLint, an online toolkit for inspecting Android APK files. Run a static, OWASP-style security review of your APK: insecure settings, exposed components, and best-practice gaps. Upload an APK in your browser to view the relevant details; results reflect what the file itself exposes.

ANALYZE · MOBILE APP SECURITY AUDIT

DONE

Drop your file here

or click to choose from your device

Select file

Accepts: .APK · up to 1 GB

Official.Trump.2020.App_v2.3.0_apkpure.com.apk

29.6 MB

Analyze

Done.

Security scan complete — 1 high-severity and 10 to review.

ERROR Exported content provider without permission

Content provider "com.facebook.FacebookContentProvider" is exported and has no android:permission. This can expose your app's data to any other app. Set android:exported="false", or guard it with read/write permissions.

WARN Exported activity without permission

<activity> "com.facebook.CustomTabActivity" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver> "io.branch.referral.InstallListener" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver> "com.phunware.engagement.internal.receiver.RebootReceiver" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN Exported receiver without permission

<receiver>
"com.phunware.engagement.internal.receiver.SignificantLocationUpdateReceiver" is exported (exported="true", or it has an intent-filter) and has no android:permission, so any app can trigger it. Add a permission, or set exported="false" if it shouldn't be public.

WARN High-risk permission: ACCESS_BACKGROUND_LOCATION

android.permission.ACCESS_BACKGROUND_LOCATION is a sensitive permission Google Play scrutinizes closely. Make sure you have a genuine, declared use and complete any required Play Console declaration — otherwise it can get the app rejected.

WARN targetSdkVersion is below Google Play's API 35 target rule (reviewed 2026-06-27)

targetSdkVersion is 28. As of 2026-06-27, Google Play required new apps and updates to target at least API 35 (Android 15) — Wear OS, Android TV, and Automotive have separate timelines. Play requirements change over time, so

verify the current target-API rule in the Play Console before release. A lower target also misses newer security and privacy defaults.

WARN Possible Cleartext http:// URL in code

Found: <http://dashif.org/guidelines/last-segment-number...>

Hard-coded secrets/keys in an APK can be extracted by anyone. Move secrets server-side; rotate anything real that's exposed.

WARN 6 sensitive API group(s) referenced

- IMEI / device ID
- Wi-Fi MAC address
- contacts
- device accounts
- last known location
- running processes

These are references in the code to APIs that can access sensitive data. Each should map to a real feature and be disclosed. (References don't prove the data leaves the device.)

WARN YARA: Dynamic code loading

The app can load code at runtime (DexClassLoader / reflection). Legitimate for plugins, but it's also how malware hides payloads — review what's being loaded.

WARN YARA: SMS-sending code strings

SMS-sending API references (sendMessage) were found in the code. Check the manifest permissions separately — SMS sending is abused by toll-fraud malware, so confirm it is expected.

INFO Network security config present

A network security config is referenced (@7F140001). Good — confirm it disables cleartext and limits trusted CAs as you intend (you can paste it into the Network Security Config checker).

INFO Launcher activity is exported (expected)

<activity>

"com.donaldjtrump.android.presentation.feature.onboarding.LaunchActivity" is your launcher entry point, so it is meant to be exported. No action needed — this is normal for the activity that opens from the home screen.

INFO receiver relies on default exported

<receiver>

"com.phunware.engagement.internal.receiver.SignificantLocationUpdateReceiver" has an intent-filter but doesn't declare android:exported. Android 12+ (targetSdk 31+) requires it to be explicit — set it true or false.

INFO 7 runtime permission(s) requested

The app requests runtime ("dangerous") permissions:

ACCESS_BACKGROUND_LOCATION, ACCESS_COARSE_LOCATION, ACCESS_FINE_LOCATION, READ_CONTACTS, READ_EXTERNAL_STORAGE, READ_PHONE_STATE, WRITE_EXTERNAL_STORAGE. Each prompts the user and should map to a real feature — remove any you don't need.

INFO minSdkVersion

minSdkVersion is 23. That's a reasonable floor for a modern app.

INFO 8 third-party SDK(s) detected

- Branch (attribution)
- Facebook SDK (social/analytics)
- Firebase (core) (google/backend)
- Firebase Analytics (analytics)
- Firebase Cloud Messaging (push)
- Firebase Crashlytics (crash/analytics)
- Google DataTransport (telemetry)
- Google Location Services (location)

INFO Analytics / tracking present

Branch, Facebook SDK, Firebase Analytics, Firebase Crashlytics. Disclose this data collection in your privacy policy and Data Safety form.

INFO YARA: Root-related strings

References to root (su/busybox/Superuser). Could be root-detection (defensive) or root-requiring behavior.

INFO YARA: Cleartext http:// URL(s) embedded

Plain-HTTP URLs were found. Traffic to these isn't encrypted.

INFO YARA: Native code / process execution

The app loads native libraries or runs processes (Runtime.exec). Normal for many apps; noted because native code isn't covered by source-level checks.

Deleted after your scan. Files you upload are processed on our servers over an encrypted connection, then removed by the next hourly cleanup after analysis finishes (long scans are protected while they run). We never share them, and need no account.

About Mobile App Security Audit

Run a static, OWASP-style security review of your APK: insecure settings, exposed components, and best-practice gaps.

Mobile App Security Audit is part of APKLint's security & malware toolkit — Find risky behavior, trackers, and suspicious patterns. It's free to use and needs no account.

Your privacy is the default: files you upload are processed on our servers over an encrypted connection and permanently deleted by a scheduled hourly cleanup after analysis finishes, and never shared.

What Mobile App Security Audit checks

- ✓ An OWASP-MASVS-style static review of the APK
- ✓ Network security: cleartext and trust configuration
- ✓ Component exposure and permission risks
- ✓ Secrets and risky code patterns

Good to know: Maps to common MASVS themes statically; it isn't a full MASVS assessment or a penetration test.

When to use Mobile App Security Audit

Best for

A structured, OWASP MASVS-style review of an APK when you want findings organized the way a mobile security checklist would group them.

Not the right tool for

Not a human penetration test and not a malware signature scan, despite covering similar ground.

What you get back

Static findings mapped to MASVS-style themes (storage, transport, platform interaction, code quality) rather than a flat list.

How it differs from related APKLint tools

Same underlying static checks as the Security Scanner, but presented in OWASP review language; the OWASP MASVS Checklist tool is the manual companion to this automated pass.

Limitations

Automated and static: it informs a MASVS review, it does not replace a tester working through the app.

How to use Mobile App Security Audit

- 1 Choose your APK file** — Drop an .apk file onto the page, or click to select it from your device.
- 2 Send securely** — The file is uploaded over an encrypted connection to our analysis servers.
- 3 Read your report** — APKLint unpacks and inspects the package and lays out the results on screen.
- 4 Your file is removed** — It's deleted by an hourly cleanup job after analysis finishes.

Why use APKLint

Always free

Every tool is free with no login and no paywall. Reasonable file and input limits keep the free service stable.

No on-page ad banners

A clean, focused interface with no third-party ad banners cluttering your results.

Privacy-first

Files you upload are deleted by a scheduled hourly cleanup after analysis finishes, and never shared.

Open-source engines

Uses androguard manifest and DEX analysis plus YARA heuristic indicators.

No sign-up

Start immediately — no account, login, or email required.

Works anywhere

Runs in any modern browser, on desktop or mobile.

Frequently asked questions

What does Mobile App Security Audit do?

Run a static, OWASP-style security review of your APK: insecure settings, exposed components, and best-practice gaps.

Is this a full MASVS audit?

No. It's a static, MASVS-themed review of common issues. A full MASVS assessment includes dynamic and manual testing.

Is it free to use?

Yes. Every tool on APKLint is completely free, with no sign-up and no account.

How is my data handled?

Your uploaded file and its result are processed on our servers over an encrypted connection, then removed by the next hourly cleanup after analysis finishes. We never share them.

What files can I send?

An Android APK — a .apk file — up to 1 GB.
