

APK Analyzer

[☆ Add to Favorites](#)

Analyze Android APK files to extract package info, permissions, and more

About APK Analyzer

A comprehensive client-side Android APK analyzer. Extract package name, version, permissions, activities, services, native libraries, and more. View the AndroidManifest.xml, calculate file hashes, and inspect the APK structure without uploading to any server. Use this apk analyzer for apk, android, apk analyzer, manifest. Built for developer workflows with practical output quality. Key capabilities include Extract package name, version, and app name, List all permissions with risk levels, View activities, services, receivers, and providers. Runs securely in your browser with no installation and no account required.

This free online apk analyzer runs directly in your browser with no installation required. It is designed for users searching for accurate results, fast processing, and privacy-first workflows.

Drop an APK file to analyze

Extract package info, permissions, signatures, and more

Why use this apk analyzer?

Use this tool to complete apk analyzer workflows quickly and accurately without sending data to third-party services. It is designed for practical browser-based usage and reliable output.

Extract package name, version, and app name	List all permissions with risk levels
View activities, services, receivers, and providers	Parse AndroidManifest.xml to readable format
Calculate MD5 and SHA-256 hashes	Detect signature versions (V1/V2)
Browse APK file structure	Extract and display app icon
Show SDK version requirements	List native libraries and supported ABIs
Fully client-side - no upload required	

Frequently Asked Questions

Is my APK uploaded to a server?

No, all analysis happens entirely in your browser using JavaScript. The APK file never leaves your device, ensuring complete privacy and security.

What information can be extracted from an APK?

You can extract the package name, version, permissions, app components (activities, services, receivers, providers), SDK requirements, native libraries, file hashes, and the AndroidManifest.xml.

What are dangerous permissions?

Dangerous permissions give apps access to sensitive user data or device features like camera, microphone, contacts, location, and storage. These require explicit user approval on Android 6.0+.

What do the signature versions mean?

V1 (JAR signing) is the original Android signature scheme. V2 (APK signing) was introduced in Android 7.0 and provides better security. V3 adds key rotation support.

Can I analyze any APK file?

Yes, you can analyze any valid APK file. However, some obfuscated or specially packaged APKs might have limited information available.

How this tool works

Step 1: Add your input

Provide the required values in APK Analyzer.

Step 2: Run the tool

Process your input instantly in your browser.

Step 3: Copy or download output

Use the result in your workflow with zero setup.

Detailed guide: APK Analyzer

If you are searching for a reliable apk analyzer online, this page is designed to give you both instant utility and clear guidance. Unlike many utilities that require account creation or upload to external services, this tool runs directly in your browser for faster iteration and better privacy control. That makes it practical for quick checks, one-off tasks, and repetitive workflows where speed and consistency matter.

Most users open this apk analyzer to reduce manual work, minimize errors, and standardize output. Whether you are a developer, analyst, marketer, student, or operations team member, browser-based tools help you complete tasks without local setup overhead. This is especially useful when collaborating across teams with different devices or environments.

What makes this tool useful

- Extract package name, version, and app name
- List all permissions with risk levels
- View activities, services, receivers, and providers
- Parse AndroidManifest.xml to readable format

Common use cases

Teams and individuals use this apk analyzer for debugging, validation, data cleanup, testing, and repeatable browser-based workflows.

Because it runs directly in your browser, it helps reduce setup time and speeds up tasks that would otherwise require scripts, local tooling, or external SaaS utilities.
