RFC2279

This document specifies an Internet standards track protocol. **RFC 2279 UTF-8** January 1998 - The first octet of a multi-octet sequence indicates the number of ...

AI Overview

RFC 2279 is a historical Internet standards track document that defined the original UTF-8 encoding format for the Universal Character Set (UCS). Published in 1998, it specified character sequences of 1 to 6 octets (bytes) to support the encoding of up to 31 bits. IETF Datatracker +3

The standard was notably updated and obsoleted by RFC 3629 in 2003, which restricted UTF-8 to a 4-byte maximum. This change aligned UTF-8 with the constraints of the official Unicode and ISO/IEC 10646 standards, capping the valid code points at U+10FFFF. Wikipedia +1

Would you like to explore:

- The technical differences between **RFC 2279 and RFC 3629**?
- How older UTF-8 implementations handle **5-byte and 6-byte sequences**?
- Modern **UTF-8 character encoding and decoding** standards?

Let me know what you'd like to dive into!
