Git - git-pack-objects Documentation

The `git unpack-objects` command can read the packed archive and expand the **objects** contained in the **pack** into "one-file one-object" format; this is typically done by the smart-pull commands when a **pack** is created on-the-fly for efficient network transport by their peers.

How do I get rid of a big pack file in my Git repository?

May 18, 2025 · I have a **Git** repository with just one branch, where a coworker pushed some big files on. After I remove the big files, the repository is approximately 200 MB, but the **Git** folder is still 1.3 GB because of a huge `.git/pack` folder. What I tried so far (based on other answers from Stack Overflow, b...

How to avoid git auto creating a .pack file? - Super User

Git doesn't always write pack files because for a small number of objects, writing loose objects can be faster. However, as the number of loose objects grows, it's important to repack periodically.

git-unpack-objects (1) - chiark

Objects that already exist in the repository will not be unpacked from the packfile. Therefore, nothing will be unpacked if you use this command on a packfile that exists within the target repository. See **git-repack (1)** for options to generate new packs and replace existing ones.
