Xcode 26.5 Release Notes

Update your apps to use new features, and test your apps against API changes.

Overview

Xcode 26.5 includes Swift 6.3 and SDKs for iOS 26.5, iPadOS 26.5, tvOS 26.5, macOS 26.5, and visionOS 26.5. Xcode 26.5 supports on-device debugging in iOS 15 and later, tvOS 15 and later, watchOS 8 and later, and visionOS. Xcode 26.5 requires a Mac running macOS Tahoe 26.2 or later.

General

Known Issues

- When streaming stdout and stderr from multiple processes at the same time (eg: in parallel testing scenarios), the results may be significantly delayed. (165098287)

Background Assets

Known Issues

- The system may incorrectly determine an app's eligibility for development overrides in simulator environments. (173742496)

Workaround: Test your app on a physical device.

Coding Intelligence

New Features

- Messages can now be queued in the coding assistant. (174563016)
- Agents can now ask clarifying questions to provide more accurate results. (175182375)

Resolved Issues

- Fixed: An issue causing malformed data in RunSomeTests MCP tool call (170415923)
- Fixed: Users interacting with Claude Code might receive an error message about their OAuth token being expired. (175464325)

Instruments

Resolved Issues

- Fixed: Typing in the filter field at the bottom of the Symbols window would create a token for every character (172423349)
- Fixed an issue where profiling using Metal System Trace with GPU Counters capture could cause memory footprint of Instruments to increase to tens of gigabytes. (173195251)

Localization

Resolved Issues

- Fixed: Generated code for String Catalog symbol generation will no longer produce a compiler error for Packages that default to MainActor isolation. (173302714) (FB22329375)

Security

Resolved Issues

- Fixed: Mac (Designed for iPad) apps with pointer authentication are now compatible with macOS Tahoe 26.5 and newer. Add `LSMinimumSystemVersion` with value `26.5` to your

app's Info.plist to ensure the app only runs on Tahoe 26.5 and newer. (171174887)

Simulator

Resolved Issues

- Fixed: Pasteboard Synchronization within Simulator.app is currently not functioning. (173403967) (FB22340739)

StoreKit Testing in Xcode

New Features

- New billing plan APIs can be tested using [StoreKit Testing in Xcode](#). Configure a monthly with 12-month commitment billing plan for your auto-renewable subscriptions in the StoreKit Configuration, and simulate subscribing to the billing plan through the Transaction Manager in Xcode. (168522699)

Swift

Known Issues

- When a closure with explicit captures is passed as an argument to a `nonisolated(nonsending)` parameter or converted to a `nonisolated(nonsending)` type, its isolation was inferred from the parent context instead of being directly set to `nonisolated(nonsending)`. The difference in isolation wasn't observable by callers until Swift 6.3.2, which introduced a bug fix for an actor hop optimization that previously didn't work when a `nonisolated(nonsending)` function value came from a parameter position.

In particular, this affects projects that have enabled the `NonisolatedNonsendingByDefault` feature (via `ApproachableConcurrency` or directly).

For example:

In this example, the Swift compiler would no longer hop back to `@MainActor` after `await fn()` returns because `fn` is `nonisolated(nonsending)` and should have executed on `@MainActor` already, but because the closure isolation was incorrectly inferred to be `@concurrent`, any *synchronous* calls that follow `fn` one are going to be executed in a `@concurrent` isolation context instead of the `@MainActor` one. (176582055)

Workaround: There are multiple ways to work around this issue.

2. Convert a closure into a local function that is explicitly `nonisolated(nonsending)`:

The example from Description becomes:

Testing

Resolved Issues

- Fixed: Tests fail to run on iOS 15 simulators (173337319) (FB22333623)
-
