AI Overview

When people refer to "database languages," they are typically asking about the **specialized programming languages used to define, query, and manipulate data within a database system**. [Scaler](#)

The primary **free and open-source database languages** (the dialects used to communicate with open-source databases) include:

- **SQL (Structured Query Language):** The worldwide standard for relational database management systems (RDBMS). It is used for tasks like creating tables, inserting data, and querying records.
 - **PostgreSQL:** Uses a highly advanced, standards-compliant SQL dialect known for extensibility.
 - **MySQL & MariaDB:** Highly popular open-source SQL variants for web applications.
 - **SQLite:** A serverless SQL database engine widely used in mobile and desktop applications.
 - **DuckDB:** An open-source SQL engine designed specifically for analytical queries (OLAP) and fast data science workflows. [DuckDB +5](#)
- **NoSQL Query Languages:** Used to interact with non-relational or unstructured databases. Instead of traditional tables, data is stored in formats like documents, key-value pairs, or graphs.
 - **MongoDB Query Language (MQL):** Used to interact with document databases. *(Note: MongoDB is source-available rather than strictly open-source, though free to use).*
 - **CQL (Cassandra Query Language):** The SQL-like language used for **Apache Cassandra**, a highly scalable NoSQL database.
 - **Cypher:** The query language used for **Neo4j** (the open-source graph database) to easily navigate relationships and nodes. [Instaclustr +4](#)

easily navigate relationships and nodes. 🐙 [Introduction](#) ...

Top Free & Open-Source Database Management Systems (DBMS)

Database	Data Model	Open-Source License	Best For
PostgreSQL	Relational (SQL)	PostgreSQL License	Financial data, geospatial data, and complex apps
MySQL	Relational (SQL)	GNU GPL	General-purpose web applications and content management
MariaDB	Relational (SQL)	GNU GPL	Free, community-driven drop-in replacement for MySQL
DuckDB	Relational (SQL)	MIT License	Embedded analytics and quick data science processing
SQLite	Relational (SQL)	Public Domain	Serverless local storage, mobile apps, and IoT devices
Apache Cassandra	Wide-Column (NoSQL)	Apache License	Massive datasets spread across servers without single points of failure

If you are looking to manage multiple databases or write your database queries from a single, free, open-source dashboard, you can use management clients like [DBeaver Community](#) or [Beekeeper Studio](#). 🐿️ DBeaver +1

What kind of **project or data stack** are you working on? If you tell me **what type of data you are trying to store**, I can recommend the exact database and language combination that best fits your needs.
