✦ AI Overview

There is no native `git reindex` command. Depending on what you are trying to achieve, you can use the official `git update-index` command to refresh file metadata, reset the staging area, or fix `.gitignore` tracking issues. [🔗](#)

Refresh File Metadata (Stat Cache)

If Git flags files as modified even though they have not changed (often due to tool or filesystem changes), refresh the index match: [🔗](#) Git +3

bash

```
git update-index --refresh
```

Use code with caution.

- `--refresh` : Re-matches file system stat details with the index.
- **Impact:** Safe. Does not alter your code or file content. [🔗](#) Git +1

Completely Rebuild the Index (Fresh Start)

If the index file is corrupted or behaving unexpectedly, you can safely delete and rebuild it from scratch: [🔗](#)

bash

```
rm .git/index  
git reset
```

Use code with caution.

- `rm .git/index` : Deletes the current binary staging file.
- `git reset` : Recreates the index file to match your last commit.
- **Impact:** Safe. Keeps your working directory files completely intact but unstages all staged changes. [🔗](#) Medium +3

Fix `.gitignore` Tracking Issues

If you added files to `.gitignore` but Git continues to track changes to them, you must clear them from the index cache: [U&L Unix & Linux Stack Exch...](#) +1

bash

```
git rm -r --cached .
git add .
```

Use code with caution.

- `git rm -r --cached .` : Remotely un-stages every file from the index while keeping them on your disk.
- `git add .` : Re-adds files, forcing Git to respect the current rules in your `.gitignore` file.
- **Impact:** Creates a staged change. You must commit this to apply the `.gitignore` update. [graphite.com](#) +4
