git commit stopped working - Error building trees - Stack Overflow

You might have a corrupted **object** in your **git** repository. If you have a remote, or other clones of this repository, you could grab from there the problematic file and just replace it on your local repo.

How can I fix the Git error "object file ... is empty"?

You can also `cd` into the `.git` directory and run `find . -type f -empty -delete -print` to remove all empty files. Eventually **Git** started telling me it was actually doing something with the **object** directories: ... After deleting all of the empty files, I eventually came to `git fsck` actually running: ... Try `git reflog`. Fail...

Mar 9, 2026 · How to fix **Git fatal not a valid object name** error caused by empty repositories, wrong branch names, missing initial commits, and corrupted refs.

git commit stopped working - Error

<https://stackoverflow.com/...>

This **error** means that you have a file with hash `13da9eeff5a9150cf2135aaed4d2e337f97b8114`, and this hash is not present in `.git/objects/...`, or it's empty. When this **error** occurred, I only had this hash in the **error**, without the file path. Then I tried to do `git gc --auto` and `git reset --hard`. After one of these commands (these commands did not fix my problem), I got the path of the file that triggers the **error**.

You just need to generate the object hash:

```
git hash-object -w  
spec/routing/splits_routi  
ng_spec.rb
```

For more information see documentation. In the documentation, there is an additional way of repairing this **error**.

P.S. This was the only way that was helpful for me.

...

'error: invalid object' after hook invokes Git commands #1849

If a pre-commit hook invokes certain **Git** commands it may inadvertently modify the **Git** index of the original repository and cause the commit to fail with an **invalid object error**.
