python - pip on MINGW64? - Stack Overflow

Thanks, @OndrejK. - I kinda thought that `python3 -m pip install --upgrade pip` would install `pip` if not present, but obviously, that cannot happen, since that command calls `pip` itself. Anyways, tried to install `pip` in MINGW64, cannot do it - updated the OP with the results ...

Error running 'pip install': "ImportError: No module named pip"

This runs the `pip` module and asks it to find the requests library on pypi.org (the Python Package Index) and install it in your local system so that it becomes available for you to import.

Pip on MINGW64

<https://stackoverflow.com/...>

With Mingw-64, `pip` is patched downstream in the package. To install the package run: `pacman -S mingw-w64-x86_64-python-pip`

You should then be able to install jupyter and other packages using `python -m pip`, but avoid running `python -m pip --upgrade pip` because that will overwrite the packaged version.

I would also recommend using a virtualenv by running `python -m venv .venv` and source `.venv/bin/activate` to keep the `pip` installed packages completely separate.

Note: It's important to understand that **pip** is not a built-in Python **module**. It's a package manager that comes bundled with the latest Python installations. If it's missing, it doesn't mean there's something wrong with Python itself. It just means that Python can't find it.
