Tar Errors: Ignoring Unknown Extended Header Keyword

I was running a script on Ubuntu Linux that extracted a `tar` archive, and I noticed many of the errors whizzing by my console, so what to do about them?

Create tar archive of a directory, except for hidden files?

If I use both `--no-xattrs --no-mac-metadata`, it does away with the `untar` warning "Ignoring unknown extended header keyword 'LIBARCHIVE.xattr.com.apple.provenance'" and it does not pack the `._` files. With both args, I do not need to express "copyfile" (either `envvar` or an option). Currently macOS 15.4.

Understanding output of xattr -p com.apple.quarantine

The other day I was messing with some files that had the **extended** attribute `com.apple.quarantine` on them. I am aware of its purpose, but I have always been curious what the properties below meant when you output its values. E.g. when I typed in `xattr -p com.apple.quarantine xmlrpc.php` for a file that has...
