Git LFS (Large File Storage) on GitHub ¹

Git LFS (Large File Storage) is an extension for Git that allows developers to manage large files efficiently by replacing them with lightweight references in the repository. It is particularly useful for handling large binary files like images, videos, or datasets that are not well-suited for Git's default storage mechanism.

Key Features

Git LFS stores large files in a separate storage space while keeping lightweight pointers in the Git repository. This reduces the size of the repository and improves performance. It supports tracking specific file types using patterns and integrates seamlessly with Git commands.

Installation

Git LFS can be installed on various platforms:
