MORPHEUS 1.5 Release developing Supported OS linux downloads 10M license package not found

Morpheus - automated ettercap TCP/IP Hijacking tool

 [morpheus v1.5-Alpha](#)

Version release : v1.5-Alpha

Author : pedro ubuntu [r00t-3xp10it]

Distros Supported : Linux Ubuntu, Kali, Mint, Parrot OS

Suspicious-Shell-Activity (SSA) RedTeam develop @2016

LEGAL DISCLAIMER

The author does not hold any responsibility for the bad use of this tool, remember that attacking targets without prior consent is illegal and punished by law.

Framework description

morpheus.sh framework automates tcp/udp packet manipulation tasks by using ettercap filters to manipulate target http requests under MitM attacks replacing the http packet contents by our own contents before sending the packet back to the host that have request for it (tcp/ip hijacking).

work flow:

- 1º - arp poison local lan (mitm)
- 2º - target requests webpage from network (wan)
- 3º - attacker modifies webpage response (contents)
- 4º - modified packet its forward back to target host

"morpheus automates the above described steps in a easy-automated-user-friendly-interface"

What can we accomplish by using filters?

morpheus ships with a collection of etter filters written by me to accomplish various tasks:
replacing images in webpages, replace text in webpages, inject payloads using html <form> tag
denial-of-service attack (drop,kill packets from source), https/ssh downgrade attacks, redirect
target browser traffic to another ip address (domain) and also gives you the ability to build
compile your filter from scratch and lunch it through morpheus framework.

"filters can be extended using browser languages like:
javascript,css,flash,etc"...

In this example we are using 'CSS3' to trigger webpage 180º rotation

 [morpheus v1.2-Alpha](#) In this example we are using 'head HTML tag' to inject an redirection url into target request  [morpheus v1.2-Alpha](#)

Framework limitations

1º - morpheus will fail if target system its protected again arp poison attacks
2º - downgrade attacks will fail if browser target as installed no-http addon's
3º - target system sometimes needs to clear netcache for arp poison be effective

incorrect number of token (///) in TARGET !!  [morpheus v1.2-Alpha](#)

morpheus by default will run ettercap using IPv6 (USE_IPV6=ACTIVE) like its previous configured into 'settings' file, if you are reciving this error than edit settings file befor runing morpheus and set (USE_IPV6=DISABLED) to force ettercap to use IPV4

Dependencies

ettercap, nmap, zenity

Credits

alor&naga (ettercap framework) | fyodor (nmap framework)
filters: irongeek (replace img) | seannicholls (rotate 180º)
Most of the filters in morpheus framework have been writen be me except the ones described above, but this project will contemplate new external (authors) addictions found in the fast network as the project continues to grow up (new releases), also new examples can be found editing ettercap's etter.filter.examples file that will help us write new ones.
