[README](#)

Use Github pages as CDN

Step 1: create a repository

Create a remote repository on Github then clone it.

```
git clone [http or ssh link to your repo]
```

Or push your existing code from a local repo.

```
git remote add origin [http or ssh link to your repo]
git push -u origin master
```

Add a file such as an `index.html` at the root of your project folder.

Step 2: set up Github pages

- Go to the `Setting` of your repository on Github and then go to `Pages`.
- Select the branch you want to use for your page (e.g. `master`).
- Press `Save`.

When the Github page will be deployed, go to `https://[yourusername].github.io/[yourreponame]`.

Step 3: link files of your CDN to your projects

Let's say we have this file structure in our repository:

```
[yourreponame]
|_ index.html
|_ my_style.css
|_ my_script.js
```

In other projects, you can use your styles and scripts as such:

```
<!-- for css -->
<link rel="stylesheet" href="https://[yourusername].github.io/[yourreponame]/my_style.css">

<!-- for js -->
<script src="https://[yourusername].github.io/[yourreponame]/my_script.js"></script>
```
