

Projects

At Google, we use open source to innovate and we release open source to share our innovations. We encourage you to browse through our featured projects to find work to use, share, and build on!

Featured projects

(<https://opensource.google/projects/android>)

Mobile

Java

Android

(<https://opensource.google/projects/android>)

Android is an operating system and software stack created for an array of devices with different form

(<https://opensource.google/projects/kubernetes>)

Cloud

Kubernetes

(<https://opensource.google/projects/kubernetes>)

Kubernetes is a cluster management system for managing containerized

factors, including phones, tablets, wearables, TVs, automobiles, and connected devices. The primary purposes of Android are to create an open platform available for carriers, OEMs, and developers to make their ideas a reality and to provide a successful, real-world product that improves the mobile experience for users.

[View project...](#)

applications across multiple hosts, providing mechanisms for deployment, maintenance, and scaling of applications. It groups containers that make up an application into logical units for easy management and discovery.

Android

(<https://opensource.google/projects/android>)

Android is an operating system and software stack created for an array of devices with different form factors, including phones, tablets, wearables,

(<https://opensource.google/projects/angular>)

Angular

(<https://opensource.google/projects/angular>)

Angular is a development platform that aims to make web development feel effortless, focused on developer productivity, speed and testability.

(<https://opensource.google/projects/apachebeam>)

Apache Beam

(<https://opensource.google/projects/apachebeam>)

Apache Beam provides an advanced unified programming model, allowing you to implement batch and streaming data processing jobs that

TVs, automobiles, and connected devices. The primary purposes of Android are to create an open platform available for carriers, OEMs, and developers to make their ideas a reality and to provide a successful, real-world product that improves the mobile experience for users.

[Learn more...](#)

Applications built with Angular can be deployed to mobile devices and desktops as websites and native applications.

[Learn more...](#)

can run on any execution engine. It is easy to use with Apache Apex, Apache Flink, Apache Spark, and Google Cloud Dataflow among other distributed processing back-ends.

[Learn more...](#)

(<https://opensource.google/projects/bazel>)

Bazel

(<https://opensource.google/projects/bazel>)

Bazel is Google's own build tool. Bazel has built-in support for building both client and server software, including client applications for both Android and iOS

(<https://opensource.google/projects/chromium>)

Chromium

(<https://opensource.google/projects/chromium>)

Chromium is the web browser that Google Chrome is built on. It is meant to feel lightweight (cognitively and physically) and fast. When released, it

(<https://opensource.google/projects/chromiumos>)

ChromiumOS

(<https://opensource.google/projects/chromiumos>)

A fast, simple, and secure OS for people who spend most of their time on the web

platforms. It also provides an extensible framework that you can use to develop your own build rules.

[Learn more...](#)

brought a sandbox security model, minimalist user interface, and tabbed window manager that many other browsers have since adopted.

[Learn more...](#)

[Learn more...](#)

(<https://opensource.google/projects/dart>)

Dart

(<https://opensource.google/projects/dart>)

Dart is an approachable, portable, and productive language for high-quality apps on any platform.

[Learn more...](#)

(<https://opensource.google/projects/firebase-sdk>)

Firebase SDK

(<https://opensource.google/projects/firebase-sdk>)

Firebase is an app development platform that provides integrated tools to help you build, grow and monetize your apps. The Firebase SDK enables access to the Firebase services in an intuitive and idiomatic manner on several platforms.

[Learn more...](#)

(<https://opensource.google/projects/flutter>)

Flutter

(<https://opensource.google/projects/flutter>)

Flutter is an open source framework for building beautiful, natively compiled, multi-platform applications from a single codebase.

[Learn more...](#)

(<https://opensource.google/projects/fuchsia>)

Fuchsia

(<https://opensource.google/projects/fuchsia>)

Fuchsia is a modern open source operating system that's simple, secure, updatable, and performant. It provides core operating system functions like system resource management, a driver framework, and software abstractions. Fuchsia is a general purpose operating system designed to power a diverse ecosystem of hardware and software.

(<https://opensource.google/projects/gerrit>)

Gerrit

(<https://opensource.google/projects/gerrit>)

Gerrit is a highly extensible and configurable tool for web-based code review and repository management for projects using the Git version control system. It allows teams to discuss code, serve Git as an integrated experience within the larger code review flow, and manage workflows with deeply integrated and delegatable access controls.

[Learn more...](#)

(<https://opensource.google/projects/go>)

Go

(<https://opensource.google/projects/go>)

The Go programming language is an open source project to make programmers more productive.

[Learn more...](#)

(<https://opensource.google/projects/istio>)

Istio

(<https://opensource.google/projects/istio>)

Istio is an open platform that provides a uniform way to connect, manage, and secure microservices. Istio supports managing traffic flows between microservices, enforcing access policies, and aggregating telemetry data, all without requiring changes to microservice code.

[Learn more...](#)

(<https://opensource.google/projects/knative>)

Knative

(<https://opensource.google/projects/knative>)

Knative components build on top of Kubernetes, abstracting away the complex details and enabling developers to focus on what matters. Built by codifying the best practices shared by successful real-world implementations, Knative solves the “boring but difficult” parts of deploying and managing cloud native services so you don’t have to.

(<https://opensource.google/projects/kubernetes>)

Kubernetes

(<https://opensource.google/projects/kubernetes>)

Kubernetes is a cluster management system for managing containerized applications across multiple hosts, providing mechanisms for deployment, maintenance, and scaling of applications. It groups containers that make up an application into logical units for easy management and discovery.

[Learn more...](#)

(<https://opensource.google/projects/openhealthstack>)

Open Health Stack

(<https://opensource.google/projects/openhealthstack>)

Open Health Stack provides building blocks for creating next-gen healthcare apps.

[Learn more...](#)

(<https://opensource.google/projects/tensorflow>)

TensorFlow

(<https://opensource.google/projects/tensorflow>)

TensorFlow is an end-to-end open source platform for machine learning. It has a comprehensive, flexible ecosystem of tools, libraries, and community resources that lets researchers push the state-of-the-art in ML, and gives developers the ability to easily build and deploy ML-powered applications.
