TensorFlow is an end-to-end open source platform for machine learning

TensorFlow is an end-to-end open source platform for machine learning. It has a comprehensive, flexible ecosystem of tools, libraries, and community resources that lets researchers push the state-of-the-art in ML, and gives developers the ability to easily build and deploy ML-powered applications.

TensorFlow provides a collection of workflows with intuitive, high-level APIs for both beginners and experts to create machine learning models in numerous languages. Developers have the option to deploy models on a number of platforms such as on servers, in the cloud, on mobile and edge devices, in browsers, and on many other JavaScript platforms. This enables developers to go from model building and training to deployment much more easily.

Easy model building

Robust ML production anywhere

Easily train and deploy models in the cloud, on-prem, in the browser, or on-device no matter what language you use.

Powerful experimentation for research

A simple and flexible architecture to take new ideas from concept to code, to state-of-the-art models, and to publication faster.

How Google uses TensorFlow

TensorFlow is used by many internal Google products and teams including: Search, Gmail, Translate, Maps, Android, Photos, Speech, YouTube, and Play.

Fuchsia

(<https://opensource.google/projects/fuchsia>)

Fuchsia is a modern open source operating system that's simple, secure, updatable, and performant. It provides core operating system functions like system resource management, a driver framework, and software abstractions. Fuchsia is a general purpose operating system designed to power a diverse ecosystem of hardware and software.
