Chameleon-Mini

This is the official repository of ChameleonMini, a freely programmable, portable tool for NFC security analysis that can emulate and clone contactless cards, read RFID tags and sniff/log RF data. Thanks to over 1700 backers from our [Kickstarter project](#), the current Revision G has been realized by Kasper & Oswald GmbH.

The ChameleonMini RevG is now also available via the Kasper & Oswald [Webshop](#). Thank you for supporting the project!

IMPORTANT: Third-party Clones

We are aware of various third-party ChameleonMini clones or modified variants that are available on the Internet. Warning: We have evidence that some of these devices are defective or suffer from reading problems et cetera. Please understand that we cannot give support for these non-official devices, as we have no schematics / layout or other information, nor do we know the manufacturers. In case of problems, please contact the manufacturers of your device directly.

Note to the manufacturers: Some of the third-party ChameleonMini are violating the ChameleonMini license, please obey the license (see LICENSE.txt)!

First Steps

To upgrade the firmware of your ChameleonMini, please visit the [Getting Started page](#) from the [doxygen documentation](#).

Supported Cards and Codecs

See [here](#). The linked wiki page also includes notes on DESFire emulation and certain cases of application specific emulation (Gallagher).

Questions

If you have any questions, please visit the [Issues page](#) and ask your questions there so everyone benefits from the answer.

Please note that we cannot give any support if you have issues with the RevE-rebooted hardware or any GUI. Please use this issues page only for problems with the RevG hardware as distributed by Kasper & Oswald and for problems with the firmware from this page.

External Contributions

We appreciate every contribution to the project. Have a look at the [External Contributions page](#).

Repository Structure

The code repository contains

- Doc: A doxygen documentation
- Drivers: Chameleon drivers for Windows and Linux
- Dumps: Dumps of different smartcards
- Hardware: The layout and schematics of the PCB
- Firmware: The complete firmware including a modified Atmel DFU bootloader and LUFA

- Software: Contains a python tool for an easy configuration (and more) of the ChameleonMini, Note that this is currently under construction
- RevE: Contains the whole contents of the discontinued RevE repository.
- RevE-light: Contains our development files for the RevE-light - **WARNING:** currently not supported / not functional
