bash redirect stdout and stderr to file

the `&>` operator for a shortcut or `> file.txt 2>&1` for maximum compatibility. Stack Overflow +1

Overwriting a File

This replaces the file's current contents: Linuxize +3

- **Modern Bash shortcut:**

bash

```
command &> output.txt
```

Use code with caution.

- **Traditional / POSIX-compliant method:**

bash

```
command > output.txt 2>&1
```

Use code with caution.

Appending to a File

This adds the new output to the end of the existing file without erasing it: Linuxize +3

- **Modern Bash shortcut:**

bash

```
command &>> output.txt
```

Use code with caution.

- **Traditional / POSIX-compliant method:**

 bash redirect stdout and stderr to file

```
command >> output.txt 2>&1
```

Use code with caution.

Redirecting to Separate Files

If you want to view standard output and error messages in completely separate log files, split them using their file descriptor numbers (`1` for stdout, `2` for stderr): [csatlas.com +3](#)

- **Separate files (Overwrite):**

bash

```
command > stdout.log 2> stderr.log
```

Use code with caution.

- **Separate files (Append):**

bash

```
command >> stdout.log 2>> stderr.log
```

Use code with caution.

Crucial Tip on Order

When using the traditional method, the order of redirections matters. You must route `stdout` to the file first (`> output.txt`) and then direct `stderr` to `stdout` (`2>&1`). If you reverse it to `command 2>&1 > output.txt` , the errors will print to your screen instead of the file. [Stack Overflow +2](#)

If you would like to expand on this, let me know if you need to:

bash redirect stdout and stderr to file

- **Redirect output permanently** for an entire script using

exec .
