github rfc

open-source projects on GitHub to design major features or changes before any code is written. It acts as a standardized process for building community consensus and preventing structural issues. Rust Internals +3

How the GitHub RFC Process Works

1. **Proposal Draft:** A contributor forks the project's dedicated `rfcs` repository and drafts their proposal in Markdown format using a provided template.
2. **Pull Request (PR):** They submit a PR to the main repository to formally open the Request for Comments.
3. **Review & Iteration:** Community members review the document, leave inline comments, and suggest modifications.
4. **Resolution:** The core team evaluates the feedback. The proposal is either **accepted/active** (approved for implementation) or **rejected**. GitHub +4

Why Projects Use It

- **Transparency:** Anyone in the community can view and comment on the future direction of the framework.
- **Consensus-Building:** It ensures that breaking changes and substantial additions are carefully vetted before becoming part of the stable codebase.
- **Documentation:** Approved RFCs serve as a permanent historical record of why a specific design was chosen. GitHub +4

Many major open-source frameworks maintain distinct repositories for this workflow, such as the [React RFCs Repository](#) and the [Vue RFCs Repository](#).

Are you looking to **submit an RFC for a specific open-source project**, or are you trying to **set up an RFC process for your own team's GitHub repository**? Let me know and I can provide exact templates and guidelines to get you started.
